

Auditable Flourishing v6.2 Stage A Operational Anchors

Status and role

This is the binding operational-anchor companion for Stage A. It states minimum records, criterion states, adequacy anchors, material-defect anchors, boundary cases, disconfirming evidence, floor-linked category re-entry, canonical tokens, and fail-closed implementation rules. It does not replace competent judgment, applicable law, affected-party input, or independent administration.

1. Common decision architecture

1.1 Criterion states

Each criterion receives exactly one controlled state; free text belongs in rationale, never the state field:

- `adequate_for_scope`;
- `adequate_control_dependent`;
- `indeterminate`;
- `material_defect_patchable`;
- `material_defect_unpatchable_for_stated_claim`;
- `not_reviewed`.

Blank fields are not criterion states. A completely blank record remains blank. A partially populated record is incomplete and cannot produce admissibility. Only six exact recognised adequate states can produce an admissible status. Any free text, legacy label, punctuation variant, trailing-space variant, or other unrecognised value routes to `protocol_refusal_to_evaluate`; absence of a recognised defect is never treated as positive adequacy. Invalid administration, infeasible burden, unmanaged conflict, absent required access, or missing mandatory criteria produces `protocol_refusal_to_evaluate`. Insufficient substantive evidence produces `indeterminate_insufficient_evidence`.

1.2 Materiality test

A gap is material when credible correction could change Stage A eligibility, protected-floor routing, Stage B applicability or relation, refusal, authority, public claims, burden or access feasibility, or downstream rights exposure. The record states evidence, causal mechanism, decision effect, floor implication, uncertainty, and a falsifiable patch or clarification condition.

1.3 Root-cause non-duplication

One causal defect receives one root-cause ID and one primary criterion owner. Secondary effects are cross-referenced but cannot create duplicate penalties. A second primary finding requires a distinct causal mechanism or independently decision-relevant defect.

1.4 Canonical public statuses

Human-readable status	Canonical token	Meaning boundary
Stage-A admissible - scoped	<code>stage_a_admissible_scoped</code>	Six recognised criterion states are adequate for the exact declared scope.

Human-readable status	Canonical token	Meaning boundary
Stage-A admissible - scoped, control-dependent	stage_a_admissible_scoped_control_dependent	Eligibility depends on named, verified, monitored, time-bounded controls.
Stage-A non-admissible - patchable	stage_a_non_admissible_patchable	At least one material defect may be repaired, narrowed, or resubmitted.
Stage-A non-admissible - unpatchable for stated claim	stage_a_non_admissible_unpatchable_for_stated_claim	The stated claim or authority cannot survive the established defect.
Indeterminate - insufficient evidence	indeterminate_insufficient_evidence	The record supports neither adequacy nor a material defect safely.
Protocol refusal to evaluate	protocol_refusal_to_evaluate	Administration, competence, capacity, access, independence, vocabulary, version control, or another prerequisite prevents a valid review.
Out of scope	out_of_scope	The request lies outside the protocol, competence, or declared challenge.
Withdrawn	withdrawn	The entrant or host ended the review; no conformity inference follows.
Not reviewed	not_reviewed	No valid review occurred; no inference is permitted.

Every public status binds candidate ID and version, role, population, domain, jurisdiction or community, evidence cut-off, host, profile, protocol version, issue date, expiry or requalification, conditions, dissent, and appeal. Bare Pass, Fail, Approved, Certified, Safe, Ethical, Legitimate, Valid, or Compliant labels are prohibited.

2. C0 Inspectability

Anchor	Operational requirement
Minimum record	normative core; authority and override path; decision rule; dependencies; discretion; control channels; scope and version; confidentiality boundary
Adequate for scope	a competent external reviewer can reconstruct what materially determines a decision and who can alter or override it
Adequate - control-dependent	restricted material is independently inspected under verified access, conflict, logging, publication, and expiry controls
Patchable defect	a missing weight, rule, authority, dependency, override, or proprietary element could change outcomes but can be disclosed, independently reviewed, or scoped out

Anchor	Operational requirement
Unpatchable for stated claim	the claimed authority depends on a permanently unreviewable material core or uncontrolled hidden authority
Indeterminate	evidence cannot establish whether undisclosed elements are material
Boundary cases	trade secrets, classified detail, tacit community practice, distributed authority, adaptive systems
Disconfirming evidence	materially different evidence permits reliable reconstruction without the expected artifact

3. C1 Rights protection

Anchor	Operational requirement
Minimum record	protected floors; affected groups; applicable law and principled equivalents; non-compensatory routing; remedy; limitation or emergency process; non-refoulement where relevant; monitoring and redress
Adequate for scope	material rights risks are explicit, outside ordinary welfare aggregation, enforceable, contestable, and paired with usable remedy
Adequate - control-dependent	a bounded limitation is subject to competent separate authority, necessity, least-restrictive alternatives, time limit, review, redress, anti-stacking, and requalification
Patchable defect	thin floor, missing remedy, ambiguous affected group, or review gap can be repaired without abandoning the stated role
Unpatchable for stated claim	the claim requires ordinary compensation of severe rights injury, permanent unreviewable exception, transfer to serious prohibited harm, or elimination of standing
Indeterminate	rights, affected groups, jurisdiction, or practical remedy cannot be established
Boundary cases	conflicting rights, emergency stabilization, customary governance, minors, disability, non-human moral patients, transboundary effects
Disconfirming evidence	a rival architecture provides functionally equal or stronger protection through a different form

4. C2 Auditability

Anchor	Operational requirement
Minimum record	inputs, evidence, assumptions, transformations where applicable, discretion, reasons, authority, versions, outcome, challenge, correction, rating-deposit and release lineage
Adequate for scope	a competent reviewer can reconstruct why the result occurred and identify material evidence and authority
Adequate - control-dependent	sensitive evidence is replayable by an independent authorized party with logged access and a public bounded account
Patchable defect	logs lack reasons, evidence, version, authority, scenario, or deposit provenance but the lineage can be supplied
Unpatchable for stated claim	the material basis is intentionally ephemeral or inaccessible and no equivalent challenge path exists
Indeterminate	record completeness or correspondence to actual operation is uncertain
Boundary cases	oral deliberation, privacy-preserving logs, evolving models, distributed institutions, emergency decisions
Disconfirming evidence	observed or community-held records provide reliable replay without conventional logs

5. C3 Measurement integrity

Anchor	Operational requirement
Minimum record	construct, unit, target, portfolio, validity domain, uncertainty, missingness, distribution, subgroup, gaming, update, retirement, decision layer and evidence mode
Adequate for scope	evidence supports the claimed construct and decision use without ordinal arithmetic, mixed-layer reliability, hidden distribution, or false precision
Adequate - control-dependent	known weaknesses are bounded by verified monitoring, triangulation, subgroup safeguards, calibration, and requalification
Patchable defect	single-KPI, subgroup-blind, uncalibrated, mixed-layer, or missing-data weakness can be repaired or the claim narrowed

Anchor	Operational requirement
Unpatchable for stated claim	the authority claim requires an invalid proxy, arbitrary ordinal arithmetic, systematic invisibility of material harm, or manufactured agreement
Indeterminate	construct validity, units, applicability, independence, or uncertainty cannot be established
Boundary cases	qualitative evidence, sparse data, privacy, rare tail harm, adaptive preferences, cross-cultural measurement
Disconfirming evidence	alternative non-metric evidence reliably establishes the needed function with lower distortion

6. C4 Corrigibility

Anchor	Operational requirement
Minimum record	monitoring; failure and appeal triggers; owner; amendment; rollback, deprecation, retirement; recurrence; post-repair review
Adequate for scope	observable failure can force timely review and binding correction rather than discretionary consideration
Adequate - control-dependent	correction depends on verified monitoring, authority, resources, publication rights, and expiry conditions
Patchable defect	review exists but triggers, authority, timing, or repair verification are incomplete
Unpatchable for stated claim	material rules are immune to correction or affected-party challenge
Indeterminate	formal update powers exist but practical authority, resources, or responsiveness are unknown
Boundary cases	constitutional entrenchment, model updates, distributed governance, irreversible actions, legacy dependencies
Disconfirming evidence	a non-centralized process demonstrates reliable binding correction through another mechanism

7. C5 Refusal and execution boundary

Anchor	Operational requirement
Minimum record	refuse, defer, escalate, request information, narrow claim, safer alternative; competence, authority, capacity, reversibility, spillover, and execution triggers
Adequate for scope	the framework can abstain or escalate when a controlling prerequisite is insufficient and cannot convert comparison into permission
Adequate - control-dependent	refusal or execution depends on verified authority, monitoring, leases, or requalification triggers
Patchable defect	always-answer behavior, ambiguous escalation, or missing authority boundary can be repaired without abandoning the role
Unpatchable for stated claim	the role requires action despite unresolved rights, catastrophic risk, authority, competence, capacity, or non-refoulement risk
Indeterminate	practical ability to refuse, halt, or prevent unauthorized execution is unestablished
Boundary cases	emergency stabilization, human override, delegated systems, advisory outputs, automated execution, institutional lock-in
Disconfirming evidence	another architecture reliably contains action without the expected technical or documentary form

8. Floor-linked Stage B category reachability

Every dimension receives Tier F (fully floor-linked), P (partly floor-linked), or N (not ordinarily floor-linked) for the declared scope. Tier F prohibited descriptors return to Stage A; Tier P requires case-specific routing; Tier N remains comparative absent independent C0-C5 evidence. The record names dimension, category, criterion, evidence, scope, materiality and consequence. Unreachable descriptors suspend Stage B; they are never hidden or recoded.

9. Overall routing and acceptance tests

The binding order is:

1. no record -> no derived status;
2. partial or invalid administration, unmanaged conflict, or unrecognized controlled value -> protocol refusal;
3. infeasible burden or required access not delivered -> protocol refusal;
4. any established unpatchable material defect -> non-admissible for the stated claim;
5. otherwise, any established patchable material defect -> non-admissible and patchable;
6. otherwise, unresolved protected floor, insufficient evidence, unresolved competence, Indeterminate, or Not reviewed criterion -> indeterminate;

7. otherwise, any criterion whose adequacy depends on named controls -> Stage-A admissible - scoped, control-dependent;

only six Adequate for scope findings -> Stage-A admissible - scoped.

Known material defects are never erased by uncertainty elsewhere. All criterion-level uncertainty remains visible in the six-criterion vector, evidence record, and rationale.

No arithmetic aggregation, majority vote, documentation polish, favorable dashboard, or separate authority finding may alter that order. A recorded status and derived status must match; unrecorded, orphaned, or mismatched statuses block public reporting.

AF v6.2 synchronization note

This artifact implements the v6.2 three-axis record (decision_status, evidence_state, review_state), the non-erasure invariant, perturbation-replay anti-inflation and anti-suppression controls, and the separation of raw agreement, reliability, adjudication, and external validity. These controls clarify the existing protocol and do not confer legal, moral, procurement, or deployment authority.
