

Independent Audit Adjudication - AF v6.2

Only reproduced findings and genuinely stronger evidence boundaries are implemented.

AF v6.2 | 13 August 2026 | 2026-08-13T16:45:26Z

Executive disposition

Bounded revision of publication-integrity, provenance, version-binding, verification, and deposit-readiness layers; no redesign of the central non-compensatory architecture.

Finding-by-finding adjudication

Finding	Disposition	v6.2 implementation
Four latest blockers	Already closed in v6.0; regression-tested	One AF-SB12, one Stage A precedence, synchronized triplets, and current version bindings verified.
Duplicate/misleading provenance	Accepted	Removed exact duplicate; retained raw review once under accurate name; added true post-correction audit.
Artifact authority dispersed	Accepted	Added canonical registry and explicit authority/version policy.
Contemporary facts lack dated verification record	Accepted	Added official/primary-source verification record with claim boundaries.
Root verification dependency surface	Accepted	Rebuilt checks around ZIP/XML and standard-library parsing; no desktop spreadsheet application required.
Stable component versions differ from release	Not a defect; clarify	Registry distinguishes AF-v6.2 from AF-SB12-v5.6 and AF-SB-RELATION-v6.0.
Remove Stage B	Rejected	Retained as defining provisional comparison architecture; Phase 0 may sequence Stage A first.
Multiply marginal reliability values	Rejected as controlling inference	Joint Stage A performance must be estimated directly under observed or explicit dependence.
Use verification as certification	Rejected	Artifact integrity remains

Finding	Disposition	v6.2 implementation
		separate from validity, due diligence, legal conformity, and authorization.
Deposit navigation burden	Accepted	Added START_HERE.md, updated package map, repository metadata, and verification route.
Final disposition	PASS subject to final build replay	Specification-complete, publication-integrity verified, Phase 0 design-ready; external validation open.

Evidence boundary

The latest review's four serious package objections were already closed in the verified v6.0 master and were regression-tested in v6.2. The genuine remaining defect was release-engineering: duplicated and misleading provenance, no single machine-readable authority registry, and verification that could be made more portable and explicit.

v6.2 audit adjudication

Implemented: provenance deduplication and relabelling; canonical registry; artifact-authority and version policy; dated official-source fact verification; current v6.2 bindings; portable root verification; start-here route; full DOCX/PDF/workbook production replay.

Not implemented as stated: Stage B was not removed; marginal criterion coefficients were not multiplied as if independent; stable component identifiers were not mechanically renamed; artifact integrity was not relabelled as empirical validation or authorization.
