

AF v6.2 Implementation and Validation Report

Publication-integrity, provenance, verification, and deposit-readiness implementation record.

AF v6.2 | 13 August 2026 | 2026-08-13T16:45:26Z

Release objective

Use the verified v6.0 master as the build base, preserve the frozen non-compensatory architecture, and close only genuine publication-integrity, provenance, current-version, verification, and deposit-readiness defects.

Implemented layers

Area	v6.2 result
Master documents	12 synchronized publication DOCX/Markdown/PDF triplets; genuine OOXML Word files; regenerated PDFs; linked master navigation preserved.
Workbook	Current AF-v6.2 configuration, controlled vocabularies, fail-closed Stage A precedence, protected reporting, burden/access/custody/governance gates, adverse reliability capture, and trusted-time fields.
Reproducibility	Versioned reference logic, stable relation component, schemas, hostile cases, simulations, workbook copy, checksums, canonical vocabulary, and supplement verifier.
Release engineering	Canonical registry, artifact-authority policy, external fact record, provenance uniqueness, exact SHA-256 inventory, root verifier, outer-ZIP CRC, and extracted-package replay.

Current scientific boundary

AF v6.2 is specification-frozen and Phase 0 design-ready. It is not empirically validated, plural-legitimacy established, legally compliant, morally certified, community authorized, or deployment-authorized.

v6.2 bounded correction closure

The final pass deduplicated and accurately labelled provenance; added a canonical registry, artifact-authority policy, and official-source fact-verification record; synchronized active v6.2 bindings while preserving stable component identifiers; rebuilt the workbook and supplement; strengthened the root verifier; added a single start-here route; regenerated PDFs; and replayed verification from the extracted final ZIP.

All changes preserve C0-C5 non-compensation, Stage A precedence, AF-SB12-v5.6, AF-SB-RELATION-v6.0, the constitutional-legitimacy boundary, and the separation between specification integrity and external empirical validation.

AF v6.2 synchronization note

This artifact implements the v6.2 three-axis record (decision_status, evidence_state, review_state), the non-erasure invariant, perturbation-replay anti-inflation and anti-suppression controls, and the separation of raw agreement, reliability, adjudication, and external validity. These controls clarify the existing protocol and do not confer legal, moral, procurement, or deployment authority.
